

EasySave Tutorial

A Quick User Guide

Creation of a backup job

Core Configuration

By clicking on the  button. You can find the menu to input the core parameters of the backup which includes:

- **Name** → The dedicated name of the backup Job.
- **Source Directory** → The source directory that the backup Job will take files and sub directories from.
- **Target Directory** → The directory where the backup job will place the copy of the source Directory files and directories.

Configuration Extensions

Core Configuration are the fields required to create a backup, but you can access other functionalities by scrolling down:

- **Backup Type** → EasySave offers two types of backups :
 - **Full** → Copies all files from the source directory to the destination. It is the most secure method but takes the longest time.
 - **Differential** → Only copies files that have been modified or added since the last full backup. Faster.
- **Encrypted Extensions** → Want to secure your files ? EasySave partners with CryptoSoft to secure your backups, simply enters the file extensions of the files you want encrypted with a reversible encryption.
- **Encryption Key** → key used for encryption.

Global Settings

You can select the language by clicking on the  button at the top right corner of the application.

On the left bar, click on  **Settings** to access the setting menu, in it, you can configure global parameters:

- **Default Log Format** → EasySave offers two types of file extensions to write the logs in, you can visualise at any time by clicking on the left bar on  **Logs**.
- **Blocking Application** → You can write the name of a process here, if the process is running, backups will be stopped while the process is still running.
- **Log file location** → You can select if the logs are written local or on a distant server, you can also select both.
- **Prioritized Extensions** → Want specific files saved first? Enter the extensions (e.g., .pdf, .docx) that EasySave should prioritize. No other files will be backed up until these prioritized files are finished.

Launching Backups

On the left bar, click on  **Backup Jobs** to access the Backup Job menu, in it, you'll find the list of different backup previously created, you can choose to run jobs individually or all of them at once.

When a job is running, you'll be proposed options to pause/resume it, and also to cancel it.
